

CRISTIANO SILVA

Senior Blockchain & Full Stack Developer | Java, Node.js, Ethereum, dApps

Summary

Senior Blockchain and Full Stack Developer with 10+ years of experience building scalable web applications, decentralized systems, and cloud-native architectures. Skilled in backend development with Java and Node.js, smart contracts with Solidity and Ethereum, and integrating blockchain with RESTful and GraphQL APIs. Experienced in full-stack development, microservices, and DevOps best practices. Strong collaborator and mentor, leading cross-functional teams in Agile and blockchain-driven projects.

Experience

Acuity Technology Solutions

Herndon, United States

Senior Software Engineer

09/2018 - Present

- Designed and developed backend services with Java, Node.js, and smart contract integration on Ethereum and Hyperledger Fabric.
- Built decentralized applications (dApps) using Web3.js, Ethers.js, and integrated blockchain events into microservices.
- Implemented serverless architecture using AWS Lambda, Step Functions, and API Gateway for blockchain transaction processing.
- Developed RESTful and GraphQL APIs with JWT and OAuth2 authentication for secure user interactions.
- Led migration from monolithic to microservices architecture using Docker and Kubernetes, including blockchain nodes orchestration.
- Optimized PostgreSQL and MongoDB for high-throughput blockchain event storage.
- Established automated testing frameworks for backend and smart contracts using JUnit, Mocha, and Hardhat.
- Managed CI/CD pipelines for decentralized applications, including smart contract deployment automation.
- Optimized performance of critical backend services by tuning JVM garbage collection settings and leveraging AWS CloudWatch for real-time performance monitoring and troubleshooting.
- Collaborated with cross-functional teams in Agile environments to ensure the timely delivery of high-quality features, participating in daily stand-ups, sprint planning, and retrospectives.

Pluga

Rio de Janeiro, Brazil

Software Engineer

06/2014 - 08/2018

- Developed microservices in Java and GoLang with gRPC, integrating blockchain-based payment and verification services.
- Migrated legacy systems to serverless architectures and integrated decentralized storage solutions (IPFS, S3).
- Built event-driven architectures using Apache Kafka for real-time blockchain data processing.
- Implemented OAuth2.0 and JWT for secure access to blockchain-enabled APIs.
- Designed sharded MySQL and DynamoDB solutions for storing blockchain transaction logs.
- Maintained CI/CD pipelines using GitLab CI/CD for both traditional and blockchain services.

CJ Tech

Ontario, Canada

Software Developer

12/2011 - 05/2014

- Built backend applications with Java and Spring Framework, integrating early blockchain experimentation.
- Optimized SQL queries and database schemas for performance-critical applications.
- Refactored legacy systems for modular, scalable architecture suitable for blockchain integration.
- Developed automated tests and maintained Jenkins pipelines for continuous delivery.

Key Achievements

Blockchain Integration

Successfully integrated Ethereum smart contracts and Hyperledger Fabric networks into enterprise systems, reducing transaction processing time by 30%.

API & Backend Optimization

Refactored REST and GraphQL APIs, reducing response times by 40% using caching, indexing, and optimized query strategies.

Decentralized Storage & Performance

Implemented IPFS and optimized MongoDB/PostgreSQL for high-volume decentralized data processing.

Education

Singapore Institute of Management

Singapore, Singapore

Bachelor of Science in Computer Science

07/2007 - 09/2011

Skills

Programming & Frameworks: Java · Node.js · Solidity · Web3.js · Ethers.js · Spring Boot · Express.js · React · Vue.js

Blockchain & Web3: Ethereum · Hyperledger Fabric · Smart Contracts · dApps · IPFS · NFT · DeFi · Tokenization

Databases: PostgreSQL, MongoDB, MySQL, DynamoDB, Redis

Messaging & Event Systems: Kafka, RabbitMQ, Apache Camel
